

How to Create a Radar Chart in Excel

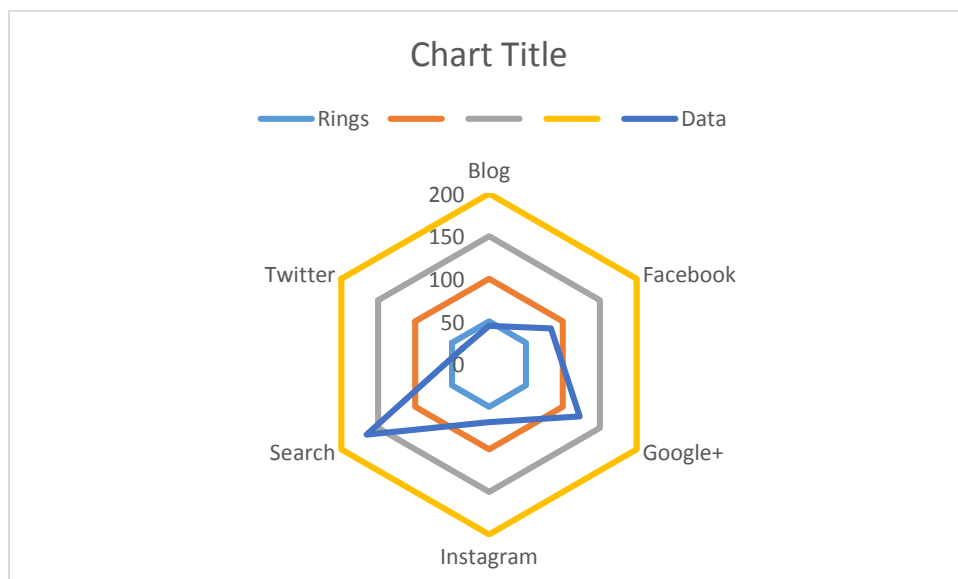

The original data show the source of the website visits and the second column shows the number of visits originating from each source.

Source	No. Visits
Blog	45
Facebook	84
Google+	123
Instagram	68
Search	166
Twitter	36

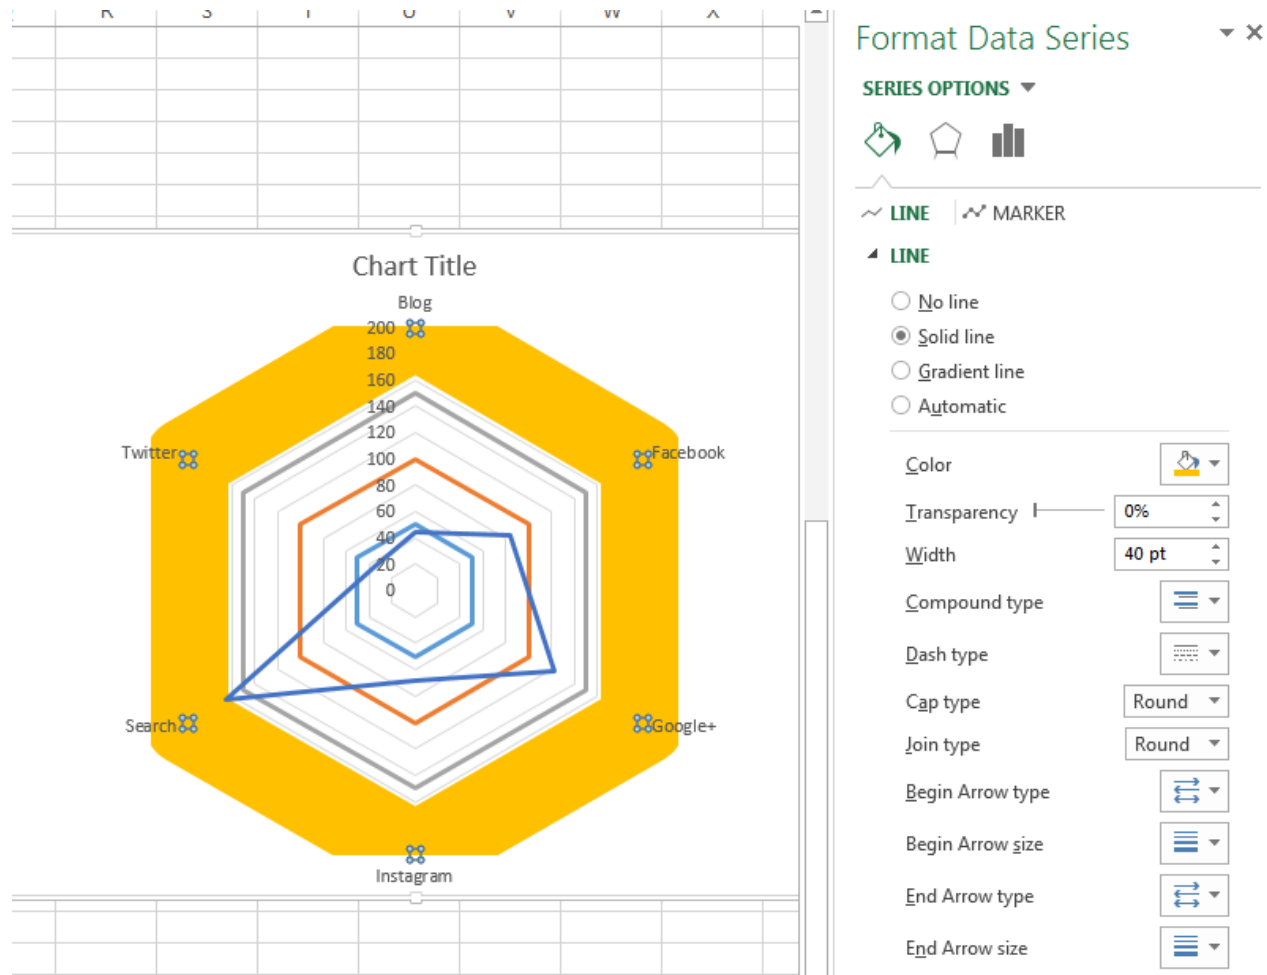

1. Insert columns into the data table that will correspond with the rings you want in the radar chart.

	Rings				Data
Blog	50	100	150	200	45
Facebook	50	100	150	200	84
Google+	50	100	150	200	123
Instagram	50	100	150	200	68
Search	50	100	150	200	166
Twitter	50	100	150	200	36

2. Create the radar chart.

3. Delete the legend.
4. Make the graph larger so you can work with it. To make it larger, just grab one of the corners and pull out at a 45 degree angle.
5. Highlight the “200” line by double clicking on it. Change the width. For this figure, we changed it to 40. You will need to experiment with each line to see how wide you want it to cover the radar chart. You can adjust the color you want each line as well.

6. Repeat step 4 for each of the lines – 150, 100, and 50. If a line does not appear on your graph or you cannot click on it, then make your graph larger. This will allow you to double-click on each line. You may have some white space between the lines, but that is okay.
7. Change the width of the data line as well and color to make it stand out.
8. You can change the chart axis values if you want so only the 50, 100, 150, and 200 show.
9. Once your graph is finished, you can reduce the size by grabbing one of the corners and moving at a 45 degree angle until all of the white spaces are gone and the graph is solid colors.
